

Green Wednesday - Global Warming

At a recent Green Wednesday (on Thursday 12th November), those attending watched the movie "**Too Hot Not to Handle**". This 2006 movie explored the causes of, results from and possible solutions for global warming. Afterwards, Dr. Tim Cooper of the Physics Department at University of the Fraser Valley brought us up to date with the thinking of the scientific community with respect to this daunting subject. One of the items he mentioned was that it is broadly accepted now that the planet can absorb 1 trillion tonnes of CO₂ and no more, without catastrophic results for mankind and the earth in general. If you want to know more about this, take a quick read of an interesting article on the BBC, discussing the 'Trillionth Tonne'. Go to the link:
